

Soil is the foundation for our existence. As a grower, the care you give your soil greatly contributes to your level of success. You test for fertility and respond with appropriate measures. You carefully prepare your soil, plant your seed, control weeds and defend your crops against pests. By performing these tasks well, you increase your likelihood of a good crop. We at Doebler's™ applaud you for your stewardship.

Research is the foundation for Doebler's and through which our hybrid seed corn varieties are selected. Rooted in the Northeast, Doebler's has the largest and most comprehensive corn research program in our region. As your soil supports your plants, a dedicated and talented staff supports our company.

Doebler's continues to sell the most hybrid seed corn produced in our region. We harvest using modern husk-on technology and dry the seed in the newest drying facility in the Northeast. Our quality seed conditioning and bagging facilities are not only the newest but also the largest in our region. Recently we've added a new small-quantity sizing plant for experimental, specialty and niche products.

In seventy years, Doebler's has advanced from my grandfather's beginning of locally growing two varieties of open-pollinated corn and distributing them in a few local counties to what is now "Your Regional Advantage"®, a seed company supplying high tech hybrid seed corn, alfalfa (conventional, hybrid and Roundup Ready®), forage grasses and legumes along with soybeans and other products in eleven states. This has been possible because we are men and women of the soil who understand crops and the need for providing the essentials for success.
